Dear Reviewer:

This letter shall certify that this *Transportation Impact Assessment* has been prepared under my direct supervision and responsible charge. I am a Registered Professional Engineer (P.E.) in the Commonwealth of Massachusetts (Massachusetts P.E. No. 38871, Civil) and hold Certification as a Professional Traffic Operations Engineer (PTOE) from the Transportation Professional Certification Board, Inc. (TPCB), an independent affiliate of the Institute of Transportation Engineers (ITE) (PTOE Certificate No. 993). I am also a Fellow of the Institute of Transportation Engineers (FITE).

Sincerely,

VANASSE & ASSOCIATES, INC.

Jeffrey S. Dirk, P.E., PTOE, FITE
Managing Partner

EXECUTIVE SUMMARY

Vanasse & Associates, Inc. (VAI) has conducted a Transportation Impact Assessment (TIA) in order to determine the potential impacts on the transportation infrastructure associated with the proposed construction of a 276-unit mixed-use development to be located at 297 Lincoln Street in Marlborough, Massachusetts (hereafter referred to as the Project). This assessment was prepared in consultation with the City of Marlborough and the Massachusetts Department of Transportation (MassDOT), and was performed in accordance with MassDOT's *Transportation Impact Assessment (TIA) Guidelines* and the standards of the Traffic Engineering and Transportation Planning professions for the preparation of such reports.

Based on this assessment, we have concluded the following with respect to the Project:

1. Using trip-generation statistics published by the Institute of Transportation Engineers (ITE)¹ and with appropriate adjustments to account for pass-by trips for the commercial component of the Project, the Project is expected to generate approximately 1,582 new vehicle trips on an average weekday (two-way, 24-hour volume), with approximately 134 new vehicle trips expected during the weekday morning peak-hour and 154 new vehicle trips expected during the weekday evening peak-hour;
2. The Project will not result in a significant impact (increase) on motorist delays or vehicle queuing over Existing or anticipated future conditions without the Project (No-Build conditions), with all movements at the study area intersections shown to continue to operate at a level-of-service (LOS) D or better with the addition of Project-related traffic, where an LOS of "D" or better is defined as "acceptable" traffic operations;
3. All movements exiting the Project site driveway to Mechanic Street and the public parking lot to Lincoln Street are predicted to operate at LOS C or better during the peak hours with queues of up to one (1) vehicle;
4. Independent of the Project, the Mechanic Street/Lincoln Street intersection was found to have a motor vehicle crash rate that is above the MassDOT average crash rate for similar intersections. A Road Safety Audit (RSA) was conducted in April 2021 that included this intersection² and resulted in specific suggestions for improvements to enhance safety. A

¹*Trip Generation*, 11th Edition; Institute of Transportation Engineers; Washington, DC; 2021.

²*Road Safety Audit*, Lincoln Street at Pleasant Street/Lincoln Street at Mechanic Street, City of Marlborough; The Engineering Corporation (TEC); April 2021.

- number of the suggested improvements have been advanced by the City and are expected to result in a reduction in the frequency and severity of the crashes occurring at the intersection; and
5. Lines of sight at the Project site driveway and public parking lot were found to meet, exceed or could be made to meet or exceed the recommended minimum sight distance to function in a safe manner based on the appropriate approach speed.

RECOMMENDATIONS

A detailed transportation improvement program has been developed that is designed to provide safe and efficient access to the Project site and address any deficiencies identified at off-site locations evaluated in conjunction with this study. The following improvements have been recommended as a part of this evaluation and, where applicable, will be completed in conjunction with the Project subject to receipt of all necessary rights, permits, and approvals.

Project Access

Access to the Project site will be provided by way of a full-access driveway that will intersect the east side of Mechanic Street generally opposite Hastings Street that will provide access to a surface parking lot and the parking garage that will be connected to the proposed residential building. Secondary access for delivery trucks and emergency vehicles will be provided by way of an easement through the City of Marlborough public parking lot that is being constructed as a part of the Project and will be accessed from a driveway that will intersect the north side of Lincoln Street approximately 100 ft to the west of the Lincoln Street/Cashman Street/Highland Street intersection. The following recommendations are offered with respect to the design and operation of the Project site access and internal circulation:

- The Project site driveway, public parking lot easement and subsequent vehicle turnaround should be a minimum of 24 feet in width and designed to accommodate the turning and maneuvering requirements of service/delivery vehicles and emergency vehicles.
- Where perpendicular parking is proposed, the drive aisle behind the parking should be a minimum of 23 feet in order to facilitate parking maneuvers.
- Vehicles exiting the Project site should be placed under STOP-sign control with a marked STOP-line provided.
- All signs and pavement markings to be installed within the Project site shall conform to the applicable standards of the *Manual on Uniform Traffic Control Devices (MUTCD)*.³
- Sidewalks should be provided to link the building entrances to the sidewalks along Lincoln Street and Mechanic Street.
- Americans with Disabilities Act (ADA) compliant wheelchair ramps should be provided for crossing the Project site driveway and public parking lot entrance, or the driveway and

³*Manual on Uniform Traffic Control Devices (MUTCD)*; Federal Highway Administration; Washington, DC; 2009.

entrance should be designed such that the sidewalks along Lincoln Street and Mechanic Street are flush with (i.e., crosses) the driveway and entrance.

- Signs and landscaping to be installed as a part of the Project within the intersection sight triangle areas of the Project site driveway and public parking lot entrance should be designed and maintained so as not to restrict lines of sight.
- Snow accumulations (windrows) within the sight triangle areas of the Project site driveway and public parking lot entrance should be promptly removed where such accumulations would impede sight lines.
- Consideration should be given to providing electric vehicle (EV) charging stations for use by residents, employees, and patrons of the Project.

Off-Site

Mechanic Street at Lincoln Street

Independent of the Project, the Mechanic Street/Lincoln Street intersection was identified to have a motor vehicle crash rate that is above the MassDOT average crash rate for similar intersections and the intersection has been identified by MassDOT as a high crash location for the period 2017-2019. A RSA has been conducted that included this intersection and the intersection of Lincoln Street at Pleasant Street, and the City has advanced a number of the safety enhancements that were suggested as an outcome of the RSA. To the extent that additional safety enhancements are deemed necessary at the intersection by the City, the Project proponent will work with the City to provide a reasonable financial contribution to the City for the design and construction of the additional safety enhancements.

Transportation Demand Management

Public transportation services are provided within the study area by the MetroWest Regional Transit Authority (MWRTA). The MWRTA provides fixed-route bus service along Lincoln Street and Mechanic Street adjacent to the Project site by way of bus Route 7C, *Inner City Marlborough*. The Route 7C bus provides service between The Wayside Inn Country Store and the Solomon Pond Mall, with the closest regular stop located at the intersection of Lincoln Street at Pleasant Street, approximately 0.4 miles (8-minute walk) to the west of the Project site; however, MWRTA buses also operate in a “flag stop” mode, where a rider can request a stop (pick-up or drop-off) anywhere along the service route where it is safe for the bus to stop by signaling to the driver. In addition, the MWRTA also operates Americans with Disabilities Act (ADA) paratransit services for eligible persons who cannot use fixed-route transit all or some of the time due to a physical, cognitive, or mental disability in compliance with the ADA.

In an effort to encourage the use of alternative modes of transportation to single-occupant vehicles (SOVs), the follow Transportation Demand Management (TDM) measures will be implemented as part of the Project:

- A transportation coordinator will be assigned for the Project to coordinate the TDM program;

- Information regarding public transportation services, maps, schedules, and fare information will be posted in a central location and/or otherwise made available to residents and employees;
- A “welcome packet” will be provided to residents and employees detailing available public transportation services, bicycle and walking alternatives, and commuter options available;
- Work-at-home workspaces will be provided to support telecommuting by residents of the Project;
- Pedestrian accommodations will be incorporated within the Project site and consist of walkways that connect to the existing sidewalks along Lincoln Street and Mechanic Street;
- A central maildrop will be provided within the building for residents; and
- Secure bicycle parking will be provided for residents, visitors/patrons and commercial tenants, including weather protected bicycle parking in a bike room located within the garage.

With implementation of the aforementioned recommendations, safe and efficient access will continue to be provided to the Project site and the Project can be accommodated within the confines of the existing and improved transportation system.

INTRODUCTION

Vanasse & Associates, Inc. (VAI) has conducted a Transportation Impact Assessment (TIA) in order to determine the potential impacts on the transportation infrastructure associated with the proposed construction of a 276-unit mixed-use development to be located at 297 Lincoln Street in Marlborough, Massachusetts (hereafter referred to as the Project). This study evaluates the following specific areas as they relate to the Project: i) access requirements; ii) potential off-site improvements; and iii) safety considerations; and identifies and analyzes existing traffic conditions and future traffic conditions, both with and without the Project, along Lincoln Street and Mechanic Street, and at major intersections located along these roadways through which Project-related traffic will travel.

PROJECT DESCRIPTION

As proposed, the Project will entail the construction of a four and five-story building that will include 276 multifamily residential units, approximately 10,074± square feet (sf) of retail space and a five-story parking garage. The Project site encompasses approximately 4.71± acres of land that is generally bounded by commercial properties and the Assabet River Rail Trail to the north; Lincoln Street to the south; the Assabet River Rail Trail to the east; and Mechanic Street and residential and commercial properties to the west. The Project site currently contains vacant buildings and an auto sales and repair shop, with associated appurtenances, that will be removed to accommodate the Project. Figure 1 depicts the Project site location in relation to the existing roadway network.

Access to the Project site will be provided by way of a full-access driveway that will intersect the east side of Mechanic Street generally opposite Hastings Street that will provide access to a surface parking lot and the parking garage that will be connected to the proposed residential building. Secondary access for delivery trucks and emergency vehicles will be provided by way of an easement through the City of Marlborough public parking lot that is being constructed as a part of the Project and will be accessed from a driveway that will intersect the north side of Lincoln Street approximately 100 ft to the west of the Lincoln Street/Cashman Street/Highland Street intersection.

MARLBOROUGH

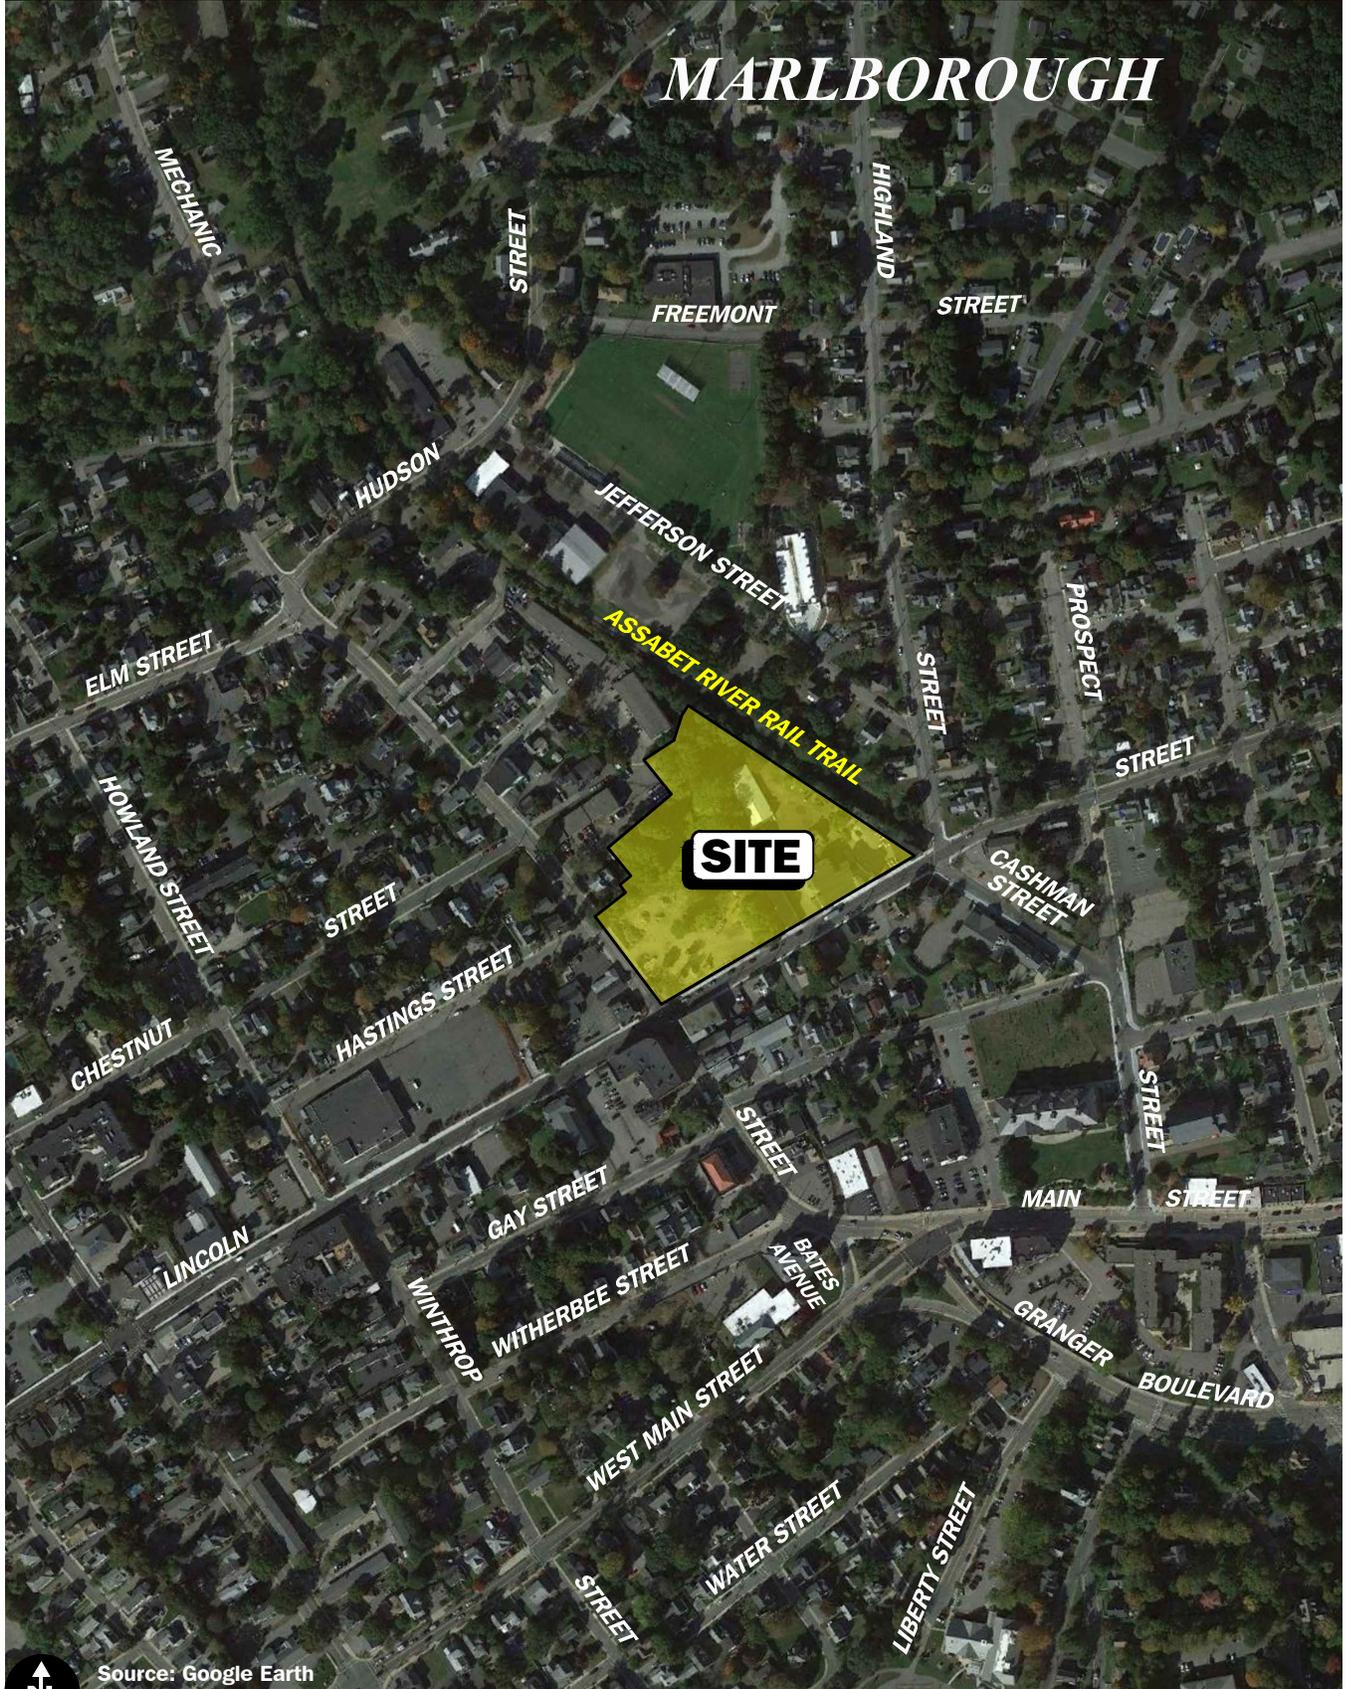

Figure 1

Site Location Map

On-site parking will be provided for 481 vehicles to accommodate residents, employees, visitors, and patrons. The proposed parking supply (481 parking spaces) exceeds the parking requirements of Section 650-48, *Off-Street Parking*, of the City of Marlborough Zoning Bylaw for the proposed mix of uses.⁴

STUDY METHODOLOGY

This study was prepared in consultation with the City of Marlborough and the Massachusetts Department of Transportation (MassDOT); was performed in accordance with MassDOT's *Transportation Impact Assessment (TIA) Guidelines* and the standards of the Traffic Engineering and Transportation Planning professions for the preparation of such reports; and was conducted in three distinct stages.

The first stage involved an assessment of existing conditions in the study area and included an inventory of roadway geometrics; pedestrian and bicycle facilities; on-street parking; public transportation services; observations of traffic flow; and collection of pedestrian, bicycle, and vehicle counts.

In the second stage of the study, future traffic conditions were projected and analyzed. Specific travel demand forecasts for the Project were assessed along with future traffic demands due to expected traffic growth independent of the Project. A seven-year time horizon was selected for analyses consistent with MassDOT's *Transportation Impact Assessment (TIA) Guidelines*. The traffic analysis conducted in stage two identifies existing or projected future roadway capacity, traffic safety, and site access issues.

The third stage of the study presents and evaluates measures to address traffic and safety issues, if any, identified in stage two of the study.

⁴The Zoning Bylaw requires a minimum of 1.0 parking spaces per multifamily dwelling unit plus 1.0 parking spaces per additional bedroom, and 1.0 parking spaces per 350 sf of retail space.

EXISTING CONDITIONS

A comprehensive field inventory of existing conditions within the study area was conducted in March and April 2022. The field investigation consisted of an inventory of existing roadway geometrics; pedestrian and bicycle facilities; public transportation services; traffic volumes; and operating characteristics; as well as posted speed limits and land use information within the study area. The study area that was assessed for the Project consisted of Lincoln Street and Mechanic Street, and the following intersections: Mechanic Street at Hastings Street; Mechanic Street at Lincoln Street; Lincoln Street at Cashman Street and Highland Street; Main Street at West Main Street, Mechanic Street, and Granger Boulevard; and West Main Street at Bates Avenue.

The following describes the study area roadways and intersections.

ROADWAYS

Lincoln Street

- Two-lane urban principal arterial roadway under City jurisdiction;
- Traverses the study area in a general northeast-southwest direction;
- Provides two 11 to 14-foot wide travel lanes that are separated by a double-yellow centerline;
- The statutory limit pursuant to M.G.L c. 90 § 17 is 30 miles per hour (mph);⁵
- Sidewalks are provided along both sides of the roadway within the study area;
- Illumination is provided by way of streetlights mounted on wooden poles; and
- Land use within the study area consists of the Project site and residential and commercial properties.

⁵The statutory or “prima facie” speed is defined in M.G.L Chapter 90, Section 17, as the speed which would be deemed reasonable and proper to operate a motor vehicle.

Mechanic Street

- Two-lane urban collector roadway under City jurisdiction;
- Traverses the study area in a general northwest-southeast direction;
- Provides two 14 to 16-foot-wide travel lanes that are separated by a double-yellow centerline;
- The statutory speed limit pursuant to M.G.L c. 90 § 17 is 30 mph;
- Sidewalks are provided along both sides of the roadway within the study area;
- Illumination is provided by way of streetlights mounted on wooden poles; and
- Land use within the study area consists of the Project site and residential and commercial properties.

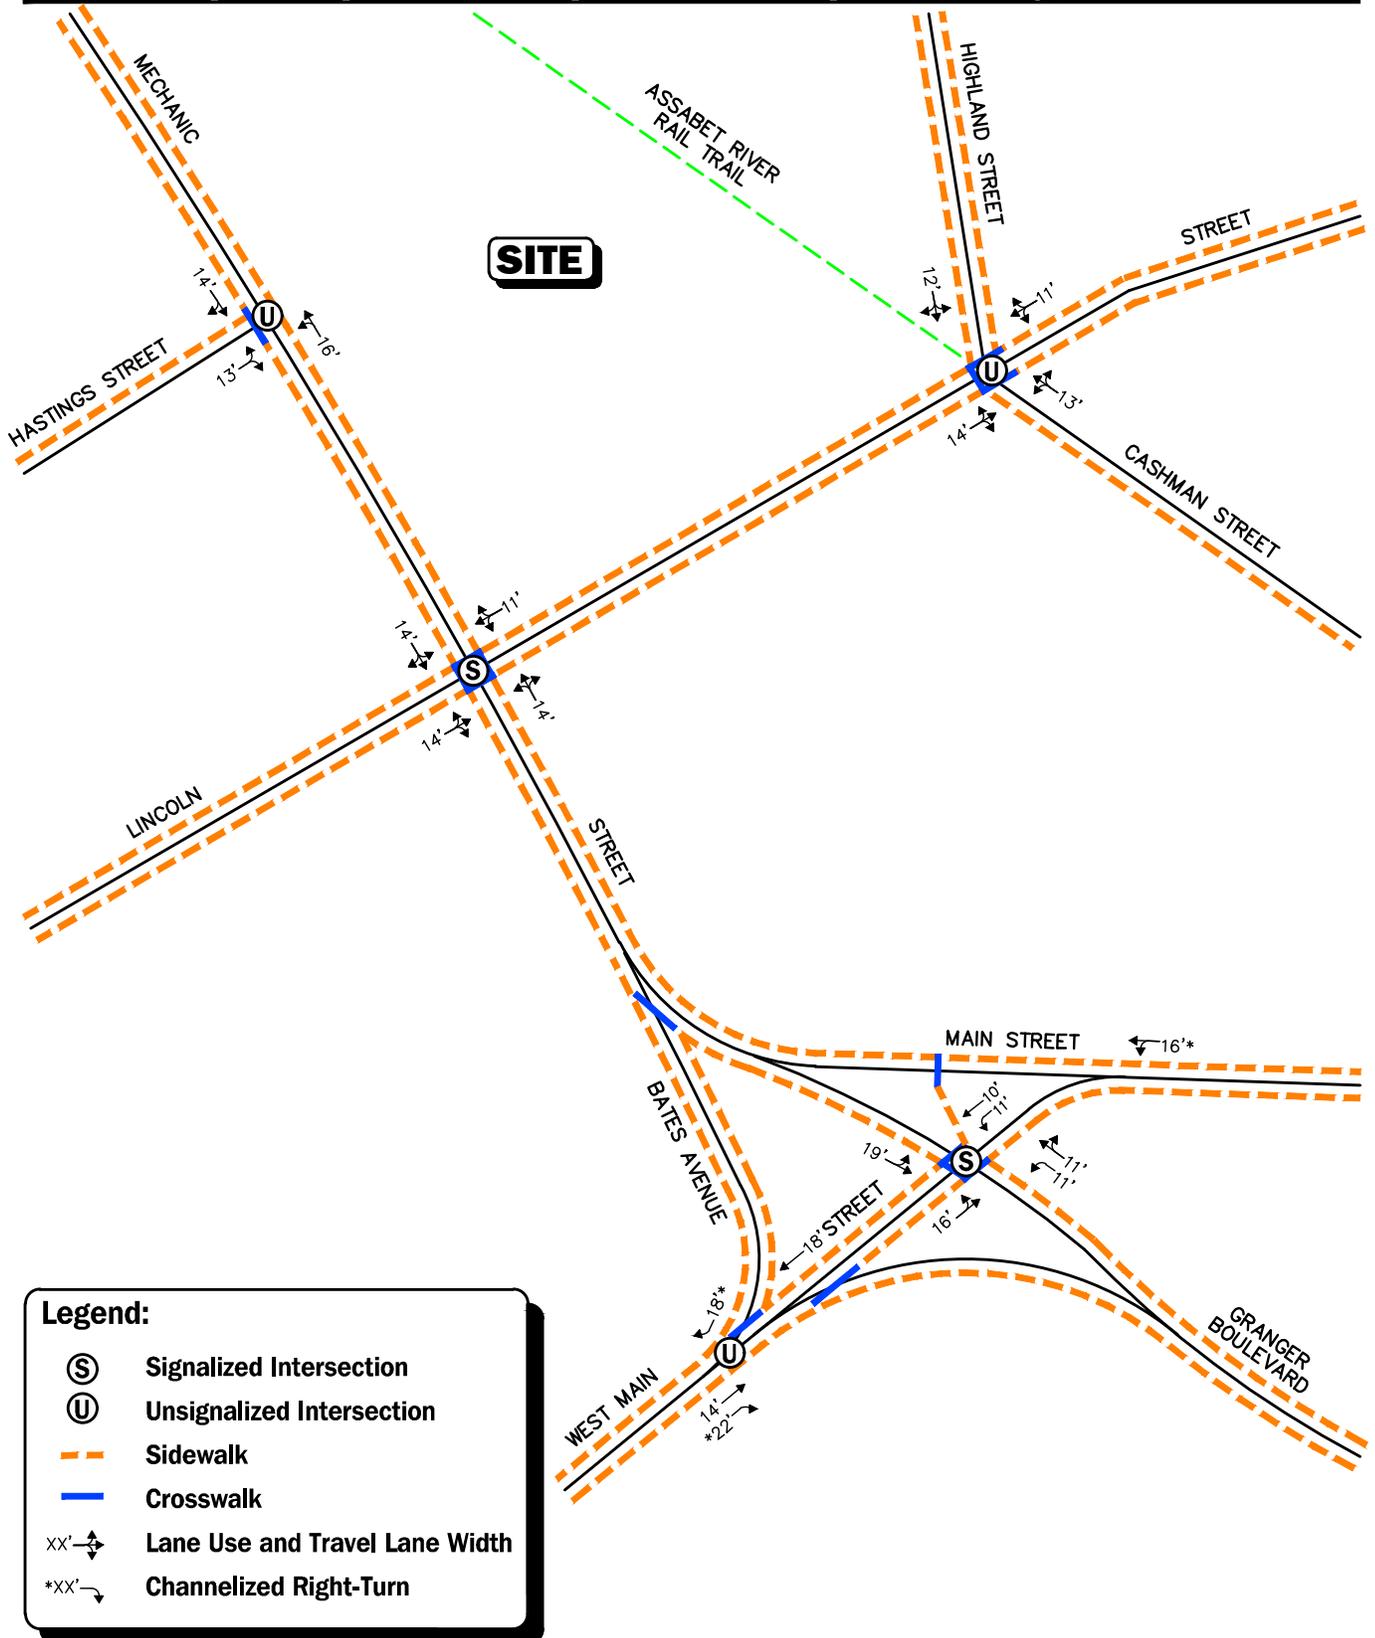

INTERSECTIONS

Table 1 and Figure 2 summarize existing lane use, traffic control, and pedestrian and bicycle accommodations at the study area intersections as observed in April 2022.

**Table 1
STUDY AREA INTERSECTIONS DESCRIPTION**

Intersection	Traffic Control Type^a	No. of Travel Lanes Provided	Shoulder Provided? (Yes/No/Width)	Pedestrian Accommodations? (Yes/No/Description)	Bicycle Accommodations? (Yes/No/Description)
Mechanic St./Hastings St.	S	1 general-purpose lane on all approaches	No	Yes; sidewalks provided along both sides of Mechanic St. and along the north side of Hastings St.; crosswalk provided for crossing Hasting St.	Yes; Shared-traveled-way ^b on Mechanic St.
Mechanic St./Lincoln St.	TS	1 general-purpose lane on all approaches, on-street parking provided along the south side of Lincoln St. west of the intersection and along the west side of Mechanic St., south of the intersection; a ‘No Turn on Red’ prohibition is posted for the Mechanic St. northbound approach	Yes; 3 to 4-feet along Lincoln St.	Yes; sidewalks provided along both sides of Mechanic St. and Lincoln St.; crosswalks provided for crossing all intersection legs that include pedestrian traffic signal equipment and phasing (exclusive)	Yes; Shared-traveled-way

See notes at end of Table.

Existing Intersection Lane Use, Travel Lane Width, and Pedestrian Facilities

Table 1 (Continued)
STUDY AREA INTERSECTIONS DESCRIPTION

Intersection	Traffic Control Type^a	No. of Travel Lanes Provided	Shoulder Provided? (Yes/No/Width)	Pedestrian Accommodations? (Yes/No/Description)	Bicycle Accommodations? (Yes/No/Description)
Lincoln St./ Cashman St./ Highland St.	S	1 general-purpose lane on all approaches	Yes; 2 to 3-feet along Lincoln St.	Yes; sidewalks provided along both sides of Lincoln St. and Highland St., and along the west side of Cashman St.; crosswalks provided for crossing Highland St., Cashman St. and the Lincoln St. west leg	Yes; Assabet River Rail Trail access is situated on the northwest corner of the intersection and crosses Lincoln St. via the crosswalk that includes bicycle crossing pavement markings
Granger Blvd./ West Main St./ Main St./ Mechanic St.	TS	1 general-purpose lane on West Main St. approach, 1 left-turn lane and 1-through lane on Main St. approach with right turns exiting prior to the intersection by way of a channelized right-turn lane, 1 left-turn lane and 1 through/right-turn lane on Granger Blvd. approach, and 1 left-turn/through lane on Mechanic St. approach with right turns exiting prior to the intersection by way of Bates Ave.; on street parking provided along both sides of Main St. east of the intersection	Yes; 1-foot along all legs	Yes; sidewalks generally provided along both sides of all legs; crosswalks provide for crossing Mechanic St., Granger Blvd. and West Main St. that include pedestrian traffic signal equipment and phasing (exclusive)	Yes; Shared-traveled-way
West Main St./ Bates Ave.	S	1 general-purpose lane on all approaches; Bates Ave. is one-way toward West Main St. and restricted to right-turn only	Yes; 1 to 2-feet on all legs	Yes; sidewalks provided along both sides of the intersecting roadways; crosswalks provided for crossing Bates Ave. and channelized right-turn to Granger Blvd.	Yes; Shared-traveled-way

^aTS = traffic signal control, S = STOP-sign control.

^bCombined shoulder and travel lane width equal to or exceed 14 feet.

TRAFFIC VOLUMES

In order to determine existing traffic-volume demands and flow patterns within the study area, automatic traffic recorder (ATR) counts, turning movement counts (TMCs), and vehicle classification counts were completed in March 2022. The ATR counts were conducted on Lincoln Street and Mechanic Street in the vicinity of the Project site on March 23rd through 24th, 2022 (Wednesday through Thursday, inclusive) in order to record weekday traffic conditions over an extended period, with peak period TMCs performed at the study intersections during the weekday morning (7:00 to 9:00 AM) and evening (4:00 to 6:00 PM) peak periods on Thursday,

March 23rd and Thursday, March 30th, 2022. These time periods were selected for analysis purposes as they are representative of the peak-traffic-volume hours for both the Project and the adjacent roadway network.

Traffic-Volume Adjustments

In order to evaluate the potential for seasonal fluctuation of traffic volumes within the study area, traffic-volume data from MassDOT Continuous Count Station AET08 located on the Massachusetts Turnpike, east of Cordaville, in Southborough were reviewed.⁶ Based on a review of this data, it was determined that traffic volumes for the month of March are approximately 3.4 percent *below* average-month conditions. As such, the March traffic volumes were adjusted upward by 3.4 percent in order to be representative of average-month conditions.

In order to account for the impact on traffic volumes and trip patterns resulting from the COVID-19 pandemic, traffic-volume data collected at MassDOT Continuous Count Station AET08 in March 2022 was compared to data collected at the same count station in March 2019. Based on this pre- and post-COVID-19 traffic-volume comparison, the traffic-volume data that was collected as part of this assessment was found to be approximately 11.8 percent *below* the conditions that existed prior to the COVID-19 pandemic. As such, the seasonally adjusted March traffic volumes were adjusted upward by an additional 11.8 percent.

The 2022 Existing traffic volumes are summarized in Table 2, with the weekday morning and weekday evening peak-hour traffic volumes graphically depicted on Figures 3 and 4, respectively. Note that the peak-hour traffic volumes that are presented in Table 2 were obtained from the aforementioned figures.

Table 2
2022 EXISTING TRAFFIC VOLUMES

Location/Peak Hour	AWT ^a	VPH ^b	K Factor ^c	Directional Distribution ^d
<i>Lincoln St., east of Mechanic St.:</i>	9,920	--	--	--
Weekday Morning (8:00 – 9:00 AM)	--	803	8.1	58.5% WB

Note: Imbalances exist due to numerous curb cuts and side streets that are not shown.

Not To Scale

Figure 4

2022 Existing
Weekday Evening
Peak-Hour Traffic Volumes

As can be seen in Table 2, Lincoln Street in the vicinity of the Project site was found to accommodate approximately 9,920 vehicles on an average weekday (two-way, 24-hour volume), with approximately 803 vehicles per hour (vph) during the weekday morning peak-hour and 938 vph during the weekday evening peak-hour. Mechanic Street in the vicinity of the Project site was found to accommodate approximately 5,080 vehicles on an average weekday, with approximately 414 vph during the weekday morning peak-hour and 593 vph during the weekday evening peak-hour.

PEDESTRIAN AND BICYCLE FACILITIES

A comprehensive field inventory of pedestrian and bicycle facilities within the study area was undertaken in April 2022. The field inventory consisted of a review of the location of sidewalks and pedestrian crossing locations along the study roadways and at the study area intersections. As detailed on Figure 2, sidewalks are generally provided along one or both sides of the study area roadways, with marked crosswalks provided for crossing one or more legs of the study area intersections and pedestrian traffic signal equipment provided for the crossings that are located at the signalized intersections within the study area.

The study area roadways generally provide sufficient width (combined travel lane and shoulder) to support bicycle travel in a shared-traveled-way configuration.⁷ In addition, the Assabet River Rail Trail, a 12.5 mile multi-purpose travel that traverses a former railroad right-of-way between the South Acton Commuter Rail station in Acton and Lincoln Street in Marlborough, bounding the Project site to the north and east, and is accessible by way of a trail head on the northwest corner of the Lincoln Street/Cashman Street/Highland Street intersection.

PUBLIC TRANSPORTATION

Public transportation services are provided within the study area by the MetroWest Regional Transit Authority (MWRTA). The MWRTA provides fixed-route bus service along Lincoln Street and Mechanic Street adjacent to the Project site by way of bus Route 7C, *Inner City Marlborough*. The Route 7C bus provides service between The Wayside Inn Country Store and the Solomon Pond Mall, with the closest regular stop located at the intersection of Lincoln Street at Pleasant Street, approximately 0.4 miles (8-minute walk) to the west of the Project site; however, MWRTA buses also operate in a “flag stop” mode, where a rider can request a stop (pick-up or drop-off) anywhere along the service route where it is safe for the bus to stop by signaling to the driver. In addition, the MWRTA also operates Americans with Disabilities Act (ADA) paratransit services for eligible persons who cannot use fixed-route transit all or some of the time due to a physical, cognitive, or mental disability in compliance with the ADA.

The public transportation schedules and fare information are provided in the Appendix.

⁷A minimum combined travel lane and paved shoulder width of 14-feet is required to support bicycle travel in a shared traveled-way condition.

SPOT SPEED MEASUREMENTS

Vehicle travel speed measurements were performed on Lincoln Street and Mechanic Street in the vicinity of the Project site in conjunction with the ATR counts. Table 3 summarizes the vehicle travel speed measurements.

Table 3
VEHICLE TRAVEL SPEED MEASUREMENTS

	Lincoln Street		Mechanic Street	
	Eastbound	Westbound	Northbound	Southbound
Mean Travel Speed (mph)	27	20	27	23
85 th Percentile Speed (mph)	31	28	30	27
Statutory Speed Limit (mph)	30	30	30	30

mph = miles per hour.

As can be seen in Table 3, the mean vehicle travel speed along Lincoln Street in the vicinity of the Project site was found to be 27 mph in the eastbound direction and 20 mph westbound. The measured 85th percentile vehicle travel speed, or the speed at which 85 percent of the observed vehicles traveled at or below, was found to be 31 mph eastbound and 28 mph westbound, which is generally consistent with the statutory speed limit in the vicinity of the Project site (30 mph). The 85th percentile speed is used as the basis of engineering design and in the evaluation of sight distances and is often used in establishing posted speed limits.

The mean vehicle travel speed along Mechanic Street in the vicinity of the Project site was found to be 27 mph in the northbound direction and 23 mph southbound, with the measured 85th percentile vehicle travel speed was found to be 30 mph northbound and 27 mph southbound, which is also generally consistent with the statutory speed limit (30 mph).

MOTOR VEHICLE CRASH DATA

Motor vehicle crash information for the study area intersections was provided by the MassDOT Highway Division Safety Management/Traffic Operations Unit for the most recent five-year period available (2015 through 2019, inclusive) in order to examine motor vehicle crash trends occurring within the study area. The data is summarized by intersection, type, severity, roadway and weather conditions, and day of occurrence, and presented in Table 4.

As can be seen in Table 4, with the exception of the Mechanic Street/Lincoln Street intersection, the study area intersections were found to have experienced an average of 4.4 or fewer reported motor vehicle crashes per year over the five-year review period and were found to have motor vehicle crash rates *below* MassDOT statewide and District average crash rates for similar intersections for the MassDOT Highway Division District in which the intersections are located (District 3). The majority of the reported crashes occurred on a weekday; under clear weather conditions; during daylight; and involved angle-type collisions that resulted in property damage only.

^dDistrictwide/Statewide crash rate.

^eThe intersection crash rate is significant if it is found to exceed the MassDOT crash rate for the MassDOT Highway Division District in which the Project is located (District 3).

The Mechanic Street/Lincoln Street intersection was found to have experienced 33 reported motor vehicle crashes over the five-year review period, or an average of 6.6 crashes per year, the majority of which occurred on a weekday; during daylight; under clear weather conditions; and involved angle-type collisions that resulted in property damage only. A Road Safety Audit (RSA) was conducted in April 2021 that included the intersections of Lincoln Street at Mechanic Street and Lincoln Street at Pleasant Street.⁸ The RSA provided specific suggestions for improvements to be advanced at both intersections to enhance safety, many of which have been completed and are expected to result in a reduction in crash frequency and severity.

A review of the MassDOT statewide high crash location list indicated that the Mechanic Street/Lincoln Street intersection is included on MassDOT's HSIP listing as a high crash cluster location for 2017 through 2019. MassDOT defines a HSIP eligible cluster as: " ...a cluster in which the total number of 'equivalent property damage only' crashes is within the top 5 percent of all clusters in that region. 'Equivalent property damage only' is a method of combining the number of crashes with the severity of crashes based on a weighted scale where a fatal crash is worth 10, an injury crash is worth 5 and a property damage only crash is worth 1." Designation as a HSIP location allows for MassDOT to prioritize funding for safety-related improvements in a specific region of the state.

The detailed MassDOT Crash Rate Worksheets are provided in the Appendix.

⁸Ibid 2.

FUTURE CONDITIONS

Traffic volumes in the study area were projected to the year 2029, which reflects a seven-year planning horizon consistent with MassDOT's *Transportation Impact Assessment (TIA) Guidelines*. Independent of the Project, traffic volumes on the roadway network in the year 2029 under No-Build conditions include all existing traffic and new traffic resulting from background traffic growth. Anticipated Project-generated traffic volumes superimposed upon the 2029 No-Build traffic volumes reflect 2029 Build traffic-volume conditions with the Project.

FUTURE TRAFFIC GROWTH

Future traffic growth is a function of the expected land development in the immediate area and the surrounding region. Several methods can be used to estimate this growth. A procedure frequently employed estimates an annual percentage increase in traffic growth and applies that percentage to all traffic volumes under study. The drawback to such a procedure is that some turning volumes may actually grow at either a higher or a lower rate at particular intersections.

An alternative procedure identifies the location and type of planned development, estimates the traffic to be generated, and assigns it to the area roadway network. This procedure produces a more realistic estimate of growth for local traffic; however, potential population growth and development external to the study area would not be accounted for in the resulting traffic projections.

To provide a conservative analysis framework, both procedures were used, the salient components of which are described below.

Specific Development by Others

The City of Marlborough Site Plan Review Committee was contacted in order to determine if there were any projects planned within the study area that would have an impact on future traffic volumes at the study intersections. Based on this consultation, no developments were identified at this time that are expected to result in an increase in traffic within the study area beyond the general background traffic growth rate (discussion follows).

General Background Traffic Growth

Traffic-volume data compiled by MassDOT from permanent count stations located in Marlborough were reviewed in order to determine general traffic growth trends in the area. This data indicates that traffic volumes have fluctuated over the past several years, with the average traffic growth rate found to be approximately 1.29 percent. In order to provide a prudent planning condition for the Project, a slightly higher 1.5 percent per year compounded annual background traffic growth rate was used in order to account for future traffic growth and presently unforeseen development within the study area.

Roadway Improvement Projects

The City of Marlborough and MassDOT were contacted in order to determine if there were any planned future roadway improvement projects expected to be complete by 2029 within the study area. Based on these discussions, no roadway improvement projects aside from routine maintenance activities were identified to be planned within the study area at this time.

No-Build Traffic Volumes

The 2029 No-Build condition peak-hour traffic volumes were developed by applying the 1.5 percent per year compounded annual background traffic growth rate to the 2022 Existing peak-hour traffic volumes. The resulting 2029 No-Build weekday morning and evening peak-hour traffic volumes are shown on Figures 5 and 6, respectively.

PROJECT-GENERATED TRAFFIC

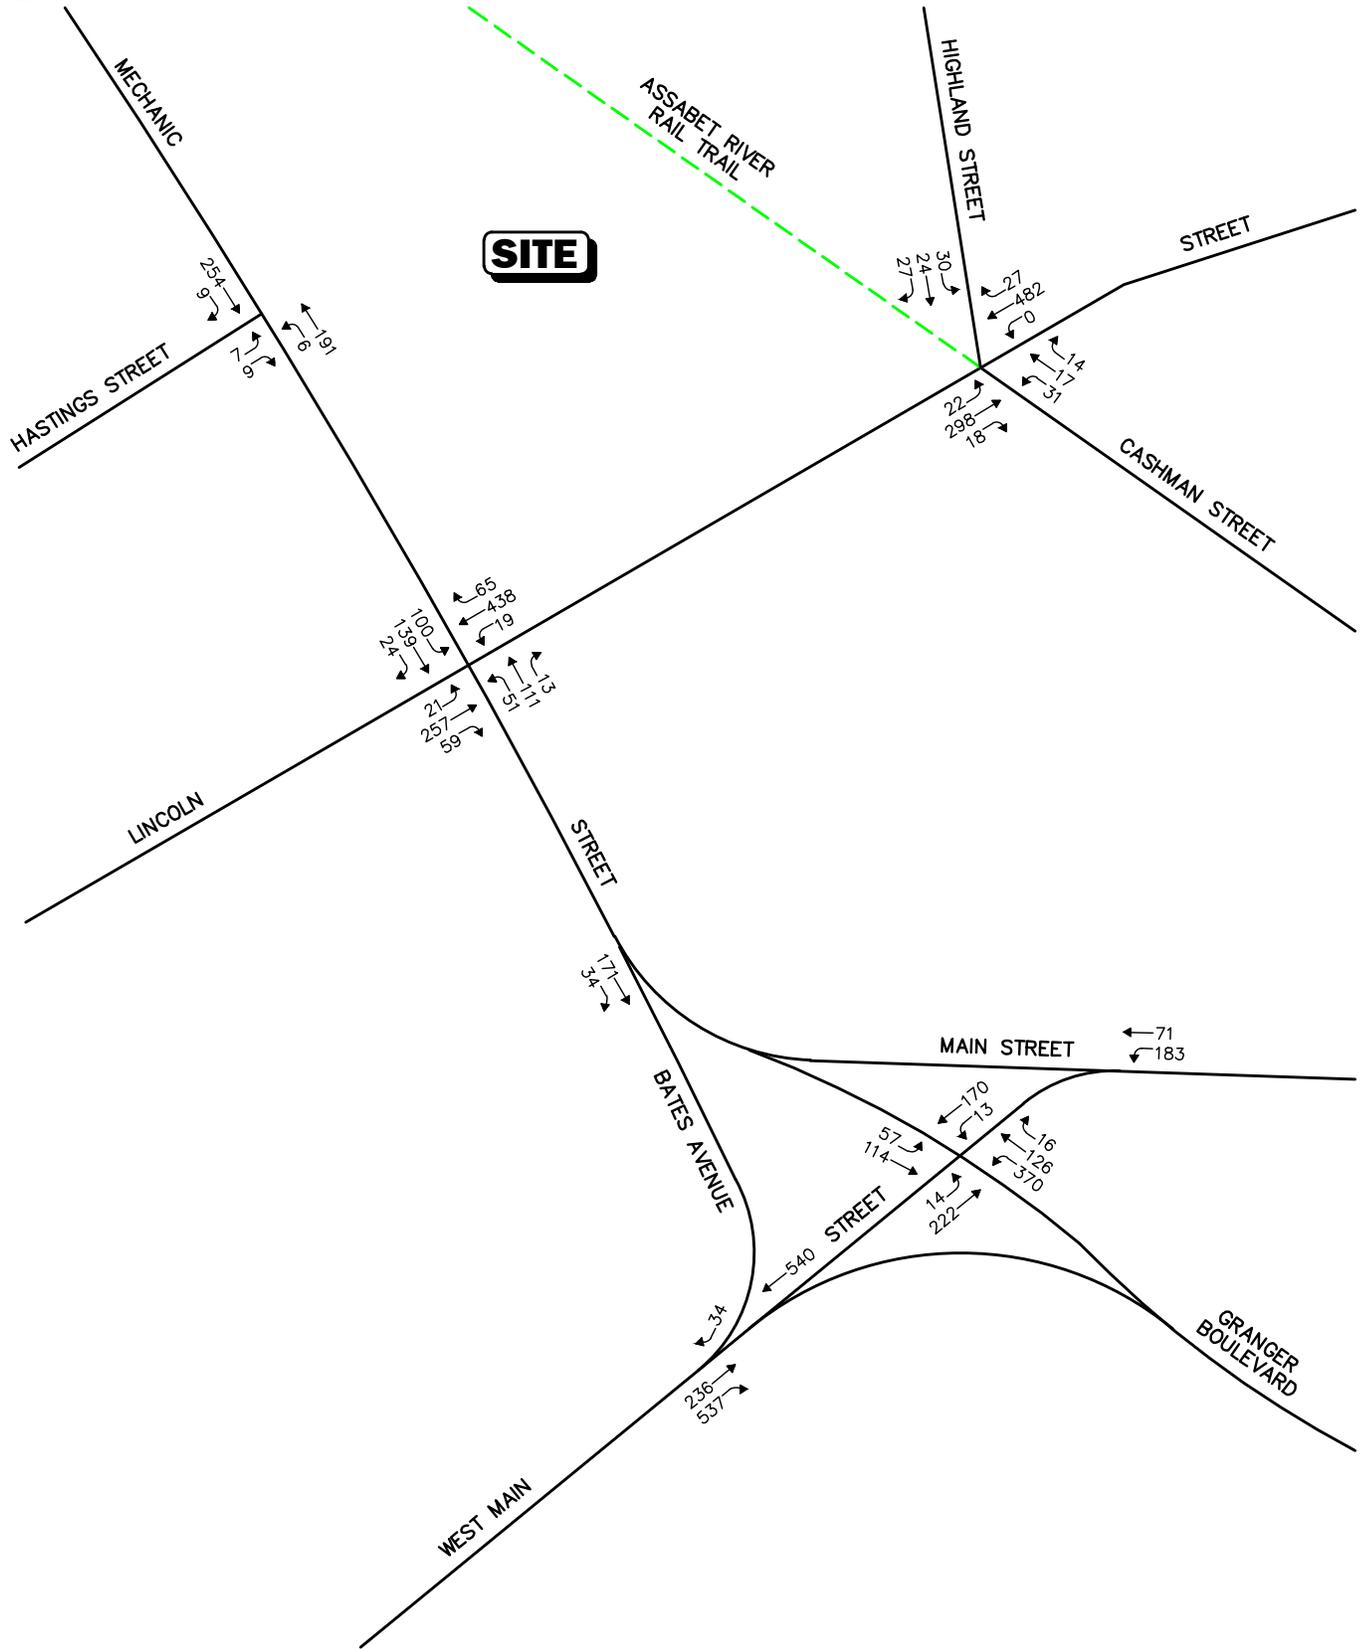

Design year (2029 Build) traffic volumes for the study area roadways were determined by estimating Project-generated traffic volumes and assigning those volumes on the study roadways. The following sections describe the methodology used to develop the anticipated traffic characteristics of the Project.

As proposed, the Project will entail the construction of a four and five-story building that will include 276 multifamily residential units and 10,074± sf of retail space. In order to develop the traffic characteristics of the Project, trip-generation statistics published by the Institute of Transportation Engineers (ITE)⁹ for similar land uses as those proposed were used. ITE Land Use Codes (LUCs) 221, *Multifamily Housing (Mid-Rise)*, and 822, *Strip Retail Plaza (<40k)*, were used to develop the base trip-generation calculations for the residential and retail components of the Project, respectively.

Internal Trips

A portion of the trips expected to be generated by the Project will consist of internal or dual-purpose trips. An internal trip consists of a resident, customer, and/or employee that patronizes more than one of the uses planned within a development and is common in mixed-use projects with appropriate accommodations to facilitate trips between uses. By way of example, a resident of the Project may patronize the retail space that is to be located within the Project site. In order to provide conservative (high) traffic volumes from which to assess the potential impact of the Project on the

transportation infrastructure, a reduction to the base ITE trip-generation calculations was not applied to account for this interaction.

Pass-By Trips

Not all of the trips expected to be generated by the retail component of the Project will be new trips on the roadway network. A significant portion of these trips will consist of pass-by trips or vehicles already traveling along adjacent roadways for other purposes that will patronize the Project in conjunction with their trip and then continue to their original destination. These trips are not new trips on the roadway network as a result of the Project. Statistics published by the ITE¹⁰ indicate that, on average, up to 40 percent of the trips generated by a retail use may consist of pass-by trips. In accordance with MassDOT guidelines which limits pass-by trips to the lesser of: i) 15 percent of the adjacent roadway traffic volume; or ii) the ITE pass-by trip rate for the specific use; the methodology that resulted in the lower volume of pass-by trips was applied to the base trip-generation calculations for the retail component of the Project.

Table 5 summarizes the anticipated traffic characteristics of the Project using the above methodology.

**Table 5
TRIP GENERATION SUMMARY**

^bBased on ITE LUC 822, *Strip Retail Plaza (<40k)*.

^cPass-by trip rate obtained from ITE LUC 821, *Shopping Plaza (40 – 150k)*, and were applied as follows: average weekday and weekday evening peak-hour = 40 percent; weekday morning peak-hour = 0 percent.

¹⁰Ibid 1.

Project-Generated Traffic-Volume Summary

As can be seen in Table 5, using the aforementioned methodology and after applying adjustments to account for pass-by trips, the Project is expected to generate approximately 1,582 new vehicle trips on an average weekday (two-way, 24-hour volume), with approximately 134 new vehicle trips (39 vehicles entering and 95 exiting) expected during the weekday morning peak-hour and 154 new vehicle trips (89 vehicles entering and 65 exiting) expected during the weekday evening peak-hour.

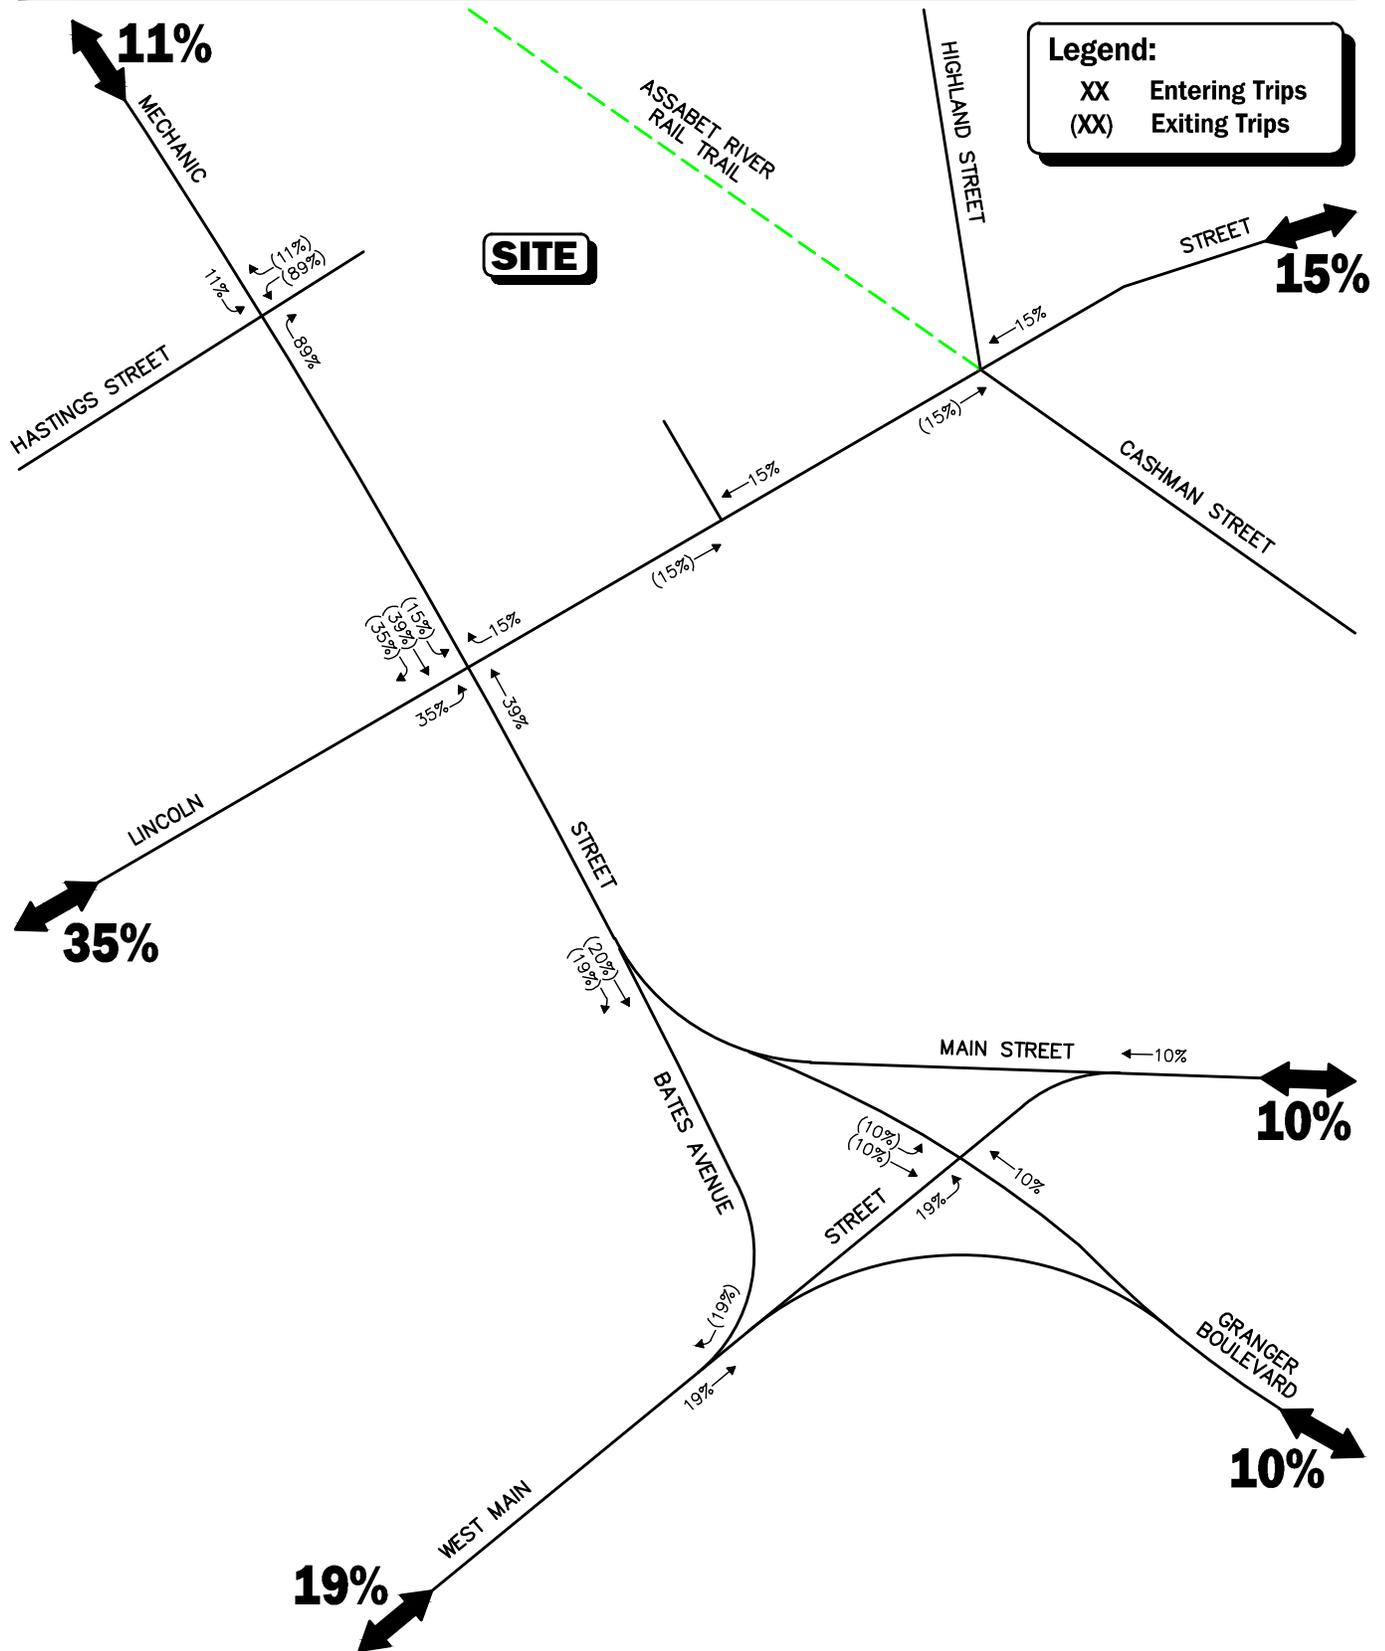

TRIP DISTRIBUTION AND ASSIGNMENT

Separate trip-distribution patterns were developed for the residential and commercial components of the Project given the differing nature and purpose of the trips associated with these uses. For the residential component of the Project, the directional distribution was determined based on a review of Journey-to-Work data obtained from the U.S. Census for persons residing in the City of Marlborough and then refined based on a review of existing traffic patterns within the study area during the peak periods. For the commercial component of the Project, the directional distribution was determined based on a review of existing traffic patterns within the study area. The general trip distribution for the residential and commercial components of the Project are graphically depicted on Figures 7 and 8, respectively. Traffic volumes expected to be generated by the residential component of the Project were assigned onto the study area roadway network as shown on Figures 9 and 10. Traffic volumes expected to be generated by the commercial component of the Project were assigned onto the study area roadway network as shown on Figures 11 and 12.

FUTURE TRAFFIC VOLUMES – BUILD CONDITION

The 2029 Build condition traffic volumes consist of the 2029 No-Build traffic volumes with the additional traffic expected to be generated by the Project added to them. The 2029 Build weekday morning and evening peak-hour traffic volumes are graphically depicted on Figures 13 and 14, respectively.

A summary of peak-hour projected traffic-volume changes outside of the study area that is the subject of this assessment is shown in Table 6. These changes are a result of the construction of the Project.

As shown in Table 6, Project-related traffic-volume increases outside of the study area relative to 2029 No-Build conditions are anticipated to range from 1.4 to 5.2 percent during the peak periods, with vehicle increases shown to range from 13 to 46 vehicles. ***When dispersed over the respective peak hours and to the roadway network that serves the Project site, the identified traffic volume increases outside of the immediate study area are not expected to result in a significant increase in motorist delays or vehicle queuing over anticipated future conditions without the Project (i.e., No-Build conditions).***

TRAFFIC OPERATIONS ANALYSIS

Measuring existing and future traffic volumes quantifies traffic flow within the study area. To assess quality of flow, roadway capacity and vehicle queue analyses were conducted under Existing, No-Build, and Build traffic-volume conditions. Capacity analyses provide an indication of how well the roadway facilities serve the traffic demands placed upon them, with vehicle queue analyses providing a secondary measure of the operational characteristics of an intersection or section of roadway under study.

METHODOLOGY

Levels of Service

A primary result of capacity analyses is the assignment of level of service to traffic facilities under various traffic-flow conditions.¹¹ The concept of level of service is defined as a qualitative measure describing operational conditions within a traffic stream and their perception by motorists and/or passengers. A level-of-service definition provides an index to quality of traffic flow in terms of such factors as speed, travel time, freedom to maneuver, traffic interruptions, comfort, convenience, and safety.

Six levels of service are defined for each type of facility. They are given letter designations from A to F, with level-of-service (LOS) A representing the best operating conditions and LOS F representing congested or constrained operating conditions.

Since the level of service of a traffic facility is a function of the traffic flows placed upon it, such a facility may operate at a wide range of levels of service, depending on the time of day, day of week, or period of year.

¹¹The capacity analysis methodology is based on the concepts and procedures presented in the *Highway Capacity Manual*; Transportation Research Board; Washington, DC; 2010.

Signalized Intersections

The six levels of service for signalized intersections may be described as follows:

- *LOS A* describes operations with very low control delay; most vehicles do not stop at all.
- *LOS B* describes operations with relatively low control delay. However, more vehicles stop than *LOS A*.
- *LOS C* describes operations with higher control delays. Individual cycle failures may begin to appear. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
- *LOS D* describes operations with control delay in the range where the influence of congestion becomes more noticeable. Many vehicles stop and individual cycle failures are noticeable.
- *LOS E* describes operations with high control delay values. Individual cycle failures are frequent occurrences.
- *LOS F* describes operations with high control delay values that often occur with over-saturation. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

Levels of service for signalized intersections are calculated using the operational analysis methodology of the 2000 *Highway Capacity Manual*¹² and implemented as a part of the Synchro® 11 software. This method assesses the effects of signal type, timing, phasing, and progression; vehicle mix; and geometrics on delay. Level-of-service designations are based on the criterion of control or signal delay per vehicle. Control or signal delay is a measure of driver discomfort, frustration, and fuel consumption, and includes initial deceleration delay approaching the traffic signal, queue move-up time, stopped delay and final acceleration delay. Table 7 summarizes the relationship between level of service and control delay. The tabulated control delay criterion may be applied in assigning level-of-service designations to individual lane groups, to individual intersection approaches, or to entire intersections.

Table 7
LEVEL-OF-SERVICE CRITERIA
FOR SIGNALIZED INTERSECTIONS^a

Level of Service	Control (Signal) Delay Per Vehicle (Seconds)
A	≤10.0
B	10.1 to 20.0
C	20.1 to 35.0
D	35.1 to 55.0
E	55.1 to 80.0
F	>80.0

^aSource: *Highway Capacity Manual*, Transportation Research Board; Washington, DC; 2000; page 16-2.

¹²*Highway Capacity Manual*; Transportation Research Board; Washington, DC; 2000.

Unsignalized Intersections

The six levels of service for unsignalized intersections may be described as follows:

- *LOS A* represents a condition with little or no control delay to minor street traffic.
- *LOS B* represents a condition with short control delays to minor street traffic.
- *LOS C* represents a condition with average control delays to minor street traffic.
- *LOS D* represents a condition with long control delays to minor street traffic.
- *LOS E* represents operating conditions at or near capacity level, with very long control delays to minor street traffic.
- *LOS F* represents a condition where minor street demand volume exceeds capacity of an approach lane, with extreme control delays resulting.

The levels of service of unsignalized intersections are determined by application of a procedure described in the 2010 *Highway Capacity Manual*.¹³ Level of service is measured in terms of average control delay. Mathematically, control delay is a function of the capacity and degree of saturation of the lane group and/or approach under study and is a quantification of motorist delay associated with traffic control devices such as traffic signals and STOP signs. Control delay includes the effects of initial deceleration delay approaching a STOP sign, stopped delay, queue move-up time, and final acceleration delay from a stopped condition. Definitions for level of service at unsignalized intersections are also given in the 2010 *Highway Capacity Manual*. Table 8 summarizes the relationship between level of service and average control delay for two-way stop controlled and all-way stop controlled intersections.

Table 8
LEVEL-OF-SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS^a

Level-Of-Service by Volume-to-Capacity Ratio		Average Control Delay (Seconds Per Vehicle)
$v/c \leq 1.0$	$v/c > 1.0$	
A	F	≤ 10.0
B	F	10.1 to 15.0
C	F	15.1 to 25.0
D	F	25.1 to 35.0
E	F	35.1 to 50.0
F	F	> 50.0

^aSource: *Highway Capacity Manual*; Transportation Research Board; Washington, DC; 2010; page 19-2.

¹³*Highway Capacity Manual*; Transportation Research Board; Washington, DC; 2010.

Vehicle Queue Analysis

Vehicle queue analyses are a direct measurement of an intersection's ability to process vehicles under various traffic control and volume scenarios and lane use arrangements. The vehicle queue analysis was performed using the Synchro® intersection capacity analysis software which is based upon the methodology and procedures presented in the 2010 *Highway Capacity Manual*. The Synchro® vehicle queue analysis methodology is a simulation based model which reports the number of vehicles that experience a delay of six seconds or more at an intersection. For signalized intersections, Synchro® reports both the average (50th percentile) the 95th percentile vehicle queue. For unsignalized intersections, Synchro® reports the 95th percentile vehicle queue. Vehicle queue lengths are a function of the capacity of the movement under study and the volume of traffic being processed by the intersection during the analysis period. The 95th percentile vehicle queue is the vehicle queue length that will be exceeded only 5 percent of the time, or approximately 3 minutes out of 60 minutes during the peak one hour of the day (during the remaining 57 minutes, the vehicle queue length will be less than the 95th percentile queue length).

ANALYSIS RESULTS

Level-of-service and vehicle queue analyses were conducted for 2022 Existing, 2029 No-Build, and 2029 Build conditions for the intersections within the study area. The results of the intersection capacity and vehicle queue analyses are summarized in Tables 9 and 10, with the detailed analysis results presented in the Appendix.

The following is a summary of the level-of-service and vehicle queue analyses for the intersections within the study area. For context, we note that an LOS of "D" or better is generally defined as "acceptable" operating conditions.

Signalized Intersection

Project-related impacts at the signalized study area intersection are shown on Table 9 and are defined as follows:

Mechanic Street at Lincoln Street

The addition of Project-related traffic was shown to result in an increase in overall motorist delay of 3.6 seconds during the weekday evening peak-hour that resulted in a degradation in overall level-of-service over No-Build conditions from LOS B to LOS C, with vehicle queues at the intersection shown to increase by up to three vehicles (3). Focusing on individual movements, operating conditions for the Lincoln Street westbound and Mechanic Street southbound approaches were shown to degrade over No-Build conditions from LOS B to LOS C during the weekday morning peak-hour as a result on a predicated increase in average motorist delay of 5.7 seconds and 2.3 seconds, respectively.

Main Street at West Main Street, Mechanic Street and Granger Boulevard

No change in overall level-of-service was shown to occur over No-Build conditions, with all movements predicted to operate at LOS D or better and vehicle queues shown to increase by up to two (2) vehicles with the addition of Project-related traffic. Operating conditions for the Mechanic Street southbound approach were shown to degrade over No-Build conditions from

LOS C to LOS D during the weekday evening peak hour as a result of a predicted increase in average motorist delay of 4.2 seconds.

Unsignalized Intersections

Project-related impacts at the unsignalized study area intersections are shown on Table 10 and are defined as follows:

Mechanic Street at Hastings Street and the Project Site Driveway

No change in level-of-service is predicted to occur for any movement over No-Build conditions, with Project-related impacts generally defined as an increase in average motorist delay of up to 1.9 seconds that resulted in an increase in vehicle queuing of up to one (1) vehicle. All movements exiting the Project site driveway to Mechanic Street were shown to operate at LOS C during both peak hours with vehicle queues of up to one (1) vehicle. All movements along Mechanic Street approaching the Project site driveway predicted to operate at LOS A during both peak hours with negligible vehicle queuing predicted.

Lincoln Street at Cashman Street and Highland Street

No change in level-of-service or vehicle queuing is predicted to occur for any movement over No-Build conditions, with Project-related impacts generally defined as an increase in average motorist delay of up to 1.5 seconds with no material increase in vehicle queuing.

West Main Street at Bates Avenue

The addition of Project-related traffic was shown to result in an increase in average motorist delay of 0.7 seconds on the Bates Avenue approach during the weekday evening peak-hour that resulted in a degradation in level-of-service over No-Build conditions from LOS B to LOS C with no material increase in vehicle queuing shown to occur.

Lincoln Street at the Public Parking Lot

All movements exiting the public parking lot onto Lincoln Street were shown to operate at LOS B during the weekday morning peak-hour and at LOS C during the weekday evening peak-hour with no material vehicle queuing predicted. All movements along Lincoln Street approaching the public parking lot are expected to operate at LOS A during the peak hours with negligible vehicle queuing predicted.

SIGHT DISTANCE EVALUATION

Sight distance measurements were performed at the Mechanic Street/Project site driveway and the Lincoln Street/public parking lot intersections in accordance with MassDOT and American Association of State Highway and Transportation Officials (AASHTO)¹⁴ requirements. Both stopping sight distance (SSD) and intersection sight distance (ISD) measurements were performed. In brief, SSD is the distance required by a vehicle traveling at the design speed of a roadway, on wet pavement, to stop prior to striking an object in its travel path. ISD or corner sight distance (CSD) is the sight distance required by a driver entering or crossing an intersecting roadway to perceive an on-coming vehicle and safely complete a turning or crossing maneuver with on-coming traffic. In accordance with AASHTO standards, if the measured ISD is at least equal to the required SSD value for the appropriate design speed, the intersection can operate in a safe manner. Table 11 presents the measured SSD and ISD at the subject intersections.

¹⁴*A Policy on Geometric Design of Highway and Streets*, 7th Edition; American Association of State Highway and Transportation Officials (AASHTO); Washington D.C.; 2018.

Table 11
SIGHT DISTANCE MEASUREMENTS^a

Intersection/Sight Distance Measurement	Feet		
	Required Minimum (SSD)	Desirable (ISD) ^b	Measured
<i>Mechanic Street at the Project Site Driveway</i>			
<i>Stopping Sight Distance:</i>			
Mechanic Street approaching from the north	200	--	500+
Mechanic Street approaching from the south	200	--	417
<i>Intersection Sight Distance:</i>			
Looking to the north from the Project Site Driveway	200	335	138/273 ^c
Looking to the south from the Project Site Driveway	200	290	500
<i>Lincoln Street at the Public Parking Lot</i>			
<i>Stopping Sight Distance:</i>			
Lincoln Street approaching from the east	250	--	500+
Lincoln Street approaching from the west	250	--	500+
<i>Intersection Sight Distance:</i>			
Looking to the east from the Public Parking Lot	250	335	500+
Looking to the west from the Public Parking Lot	250	390	500+

^aRecommended minimum values obtained from *A Policy on Geometric Design of Highways and Streets*, 7th Edition; American Association of State Highway and Transportation Officials (AASHTO); 2018; and based on a 35 mph approach speed along Lincoln Street and a 30 mph approach speed along Mechanic Street.

^bValues shown are the intersection sight distance for a vehicle turning right or left exiting a roadway under STOP control such that motorists approaching the intersection on the major street should not need to adjust their travel speed to less than 70 percent of their initial approach speed.

^cAvailable sight distance with the selective trimming/removal of trees and vegetation located within the sight triangle area of the Project site driveway.

As can be seen in Table 11, with the selective trimming/removal of a tree and vegetation located within the sight triangle to the north of the Project site driveway intersection with Mechanic Street, the available lines of sight at the Project site driveway intersection were found to exceed the recommended minimum sight distance to function in a safe manner (SSD) based on a 30 mph approach speed, with is consistent with both the measured 85th percentile speed along Mechanic Street (30/27 mph) and the statutory speed limit in the vicinity of the Project site (30 mph).

The available lines of sight at the public parking lot intersection with Lincoln Street were found to exceed the recommended minimum sight distances to function in a safe (SSD) and efficient (ISD) manner based on a 35 mph approach speed, which is slightly above both the measured 85th percentile vehicle travel speed along Lincoln Street (31/28 mph) and the statutory speed limit in the vicinity of the Project site (30 mph).

CONCLUSIONS AND RECOMMENDATIONS

CONCLUSIONS

VAI has conducted a TIA in order to determine the potential impacts on the transportation infrastructure associated with the proposed construction of a 276-unit mixed-use development to be located at 297 Lincoln Street in Marlborough, Massachusetts. The following specific areas have been evaluated as they relate to the Project: i) access requirements; ii) potential off-site improvements; and iii) safety considerations; under existing and future conditions, both with and without the Project. Based on this assessment, we have concluded the following with respect to the Project:

1. Using trip-generation statistics published by the ITE¹⁵ and with appropriate adjustments to account for pass-by trips for the commercial component of the Project, the Project is expected to generate approximately 1,582 new vehicle trips on an average weekday (two-way, 24-hour volume), with approximately 134 new vehicle trips expected during the weekday morning peak-hour and 154 new vehicle trips expected during the weekday evening peak-hour;
2. The Project will not result in a significant impact (increase) on motorist delays or vehicle queuing over Existing or anticipated future conditions without the Project (No-Build conditions), with all movements at the study area intersections shown to continue to operate at LOS D or better with the addition of Project-related traffic, where an LOS of “D” or better is defined as “acceptable” traffic operations;
3. All movements exiting the Project site driveway to Mechanic Street and the public parking lot to Lincoln Street are predicted to operate at LOS C or better during the peak hours with queues of up to one (1) vehicle;
4. Independent of the Project, the Mechanic Street/Lincoln Street intersection was found to have a motor vehicle crash rate that is above the MassDOT average crash rate for similar intersections. A Road Safety Audit (RSA) was conducted in April 2021 that included this intersection¹⁶ and resulted in specific suggestions for improvements to enhance safety. A number of the suggested improvements have been advanced by the City and are expected

¹⁵Ibid 1.

¹⁶Ibid 2.

to result in a reduction in the frequency and severity of the crashes occurring at the intersection; and

5. Lines of sight at the Project site driveway and public parking lot were found to meet, exceed or could be made to meet or exceed the recommended minimum sight distance to function in a safe manner based on the appropriate approach speed.

RECOMMENDATIONS

A detailed transportation improvement program has been developed that is designed to provide safe and efficient access to the Project site and address any deficiencies identified at off-site locations evaluated in conjunction with this study. The following improvements have been recommended as a part of this evaluation and, where applicable, will be completed in conjunction with the Project subject to receipt of all necessary rights, permits, and approvals.

Project Access

Access to the Project site will be provided by way of a full-access driveway that will intersect the east side of Mechanic Street generally opposite Hastings Street that will provide access to a surface parking lot and the parking garage that will be connected to the proposed residential building. Secondary access for delivery trucks and emergency vehicles will be provided by way of an easement through the City of Marlborough public parking lot that is being constructed as a part of the Project and will be accessed from a driveway that will intersect the north side of Lincoln Street approximately 100 ft to the west of the Lincoln Street/Cashman Street/Highland Street intersection. The following recommendations are offered with respect to the design and operation of the Project site access and internal circulation:

- The Project site driveway, public parking lot easement and subsequent vehicle turnaround should be a minimum of 24 feet in width and designed to accommodate the turning and maneuvering requirements of service/delivery vehicles and emergency vehicles.
- Where perpendicular parking is proposed, the drive aisle behind the parking should be a minimum of 23 feet in order to facilitate parking maneuvers.
- Vehicles exiting the Project site should be placed under STOP-sign control with a marked STOP-line provided.
- All signs and pavement markings to be installed within the Project site shall conform to the applicable standards of the *Manual on Uniform Traffic Control Devices (MUTCD)*.¹⁷
- Sidewalks should be provided to link the building entrances to the sidewalks along Lincoln Street and Mechanic Street.
- Americans with Disabilities Act (ADA) compliant wheelchair ramps should be provided for crossing the Project site driveway and public parking lot entrance, or the driveway and entrance should be designed such that the sidewalks along Lincoln Street and Mechanic Street are flush with (i.e., crosses) the driveway and entrance.

¹⁷Ibid 3.

- Signs and landscaping to be installed as a part of the Project within the intersection sight triangle areas of the Project site driveway and public parking lot entrance should be designed and maintained so as not to restrict lines of sight.
- Snow accumulations (windrows) within the sight triangle areas of the Project site driveway and public parking lot entrance should be promptly removed where such accumulations would impede sight lines.
- Consideration should be given to providing electric vehicle (EV) charging stations for use by residents, employees, and patrons of the Project.

Off-Site

Mechanic Street at Lincoln Street

Independent of the Project, the Mechanic Street/Lincoln Street intersection was identified to have a motor vehicle crash rate that is above the MassDOT average crash rate for similar intersections and the intersection has been identified by MassDOT as a high crash location for the period 2017-2019. A RSA has been conducted that included this intersection and the intersection of Lincoln Street at Pleasant Street, and the City has advanced a number of the safety enhancements that were suggested as an outcome of the RSA. To the extent that additional safety enhancements are deemed necessary at the intersection by the City, the Project proponent will work with the City to provide a reasonable financial contribution to the City for the design and construction of the additional safety enhancements.

Transportation Demand Management

Public transportation services are provided within the study area by the MWRTA. The MWRTA provides fixed-route bus service along Lincoln Street and Mechanic Street adjacent to the Project site by way of bus Route 7C, *Inner City Marlborough*. The Route 7C bus provides service between The Wayside Inn Country Store and the Solomon Pond Mall, with the closest regular stop located at the intersection of Lincoln Street at Pleasant Street, approximately 0.4 miles (8-minute walk) to the west of the Project site; however, MWRTA buses also operate in a “flag stop” mode, where a rider can request a stop (pick-up or drop-off) anywhere along the service route where it is safe for the bus to stop by signaling to the driver. In addition, the MWRTA also operates Americans with Disabilities Act (ADA) paratransit services for eligible persons who cannot use fixed-route transit all or some of the time due to a physical, cognitive, or mental disability in compliance with the ADA.

In an effort to encourage the use of alternative modes of transportation to single-occupant vehicles (SOVs), the follow Transportation Demand Management (TDM) measures will be implemented as part of the Project:

- A transportation coordinator will be assigned for the Project to coordinate the TDM program;
- Information regarding public transportation services, maps, schedules, and fare information will be posted in a central location and/or otherwise made available to residents and employees;

- A “welcome packet” will be provided to residents and employees detailing available public transportation services, bicycle and walking alternatives, and commuter options available;
- Commercial tenants will be encouraged to offer specific amenities to discourage off-site trips, including providing a breakroom equipped with a microwave and refrigerator; offering direct deposit of paychecks; and other such measures to reduce overall traffic volumes and travel during peak-traffic-volume periods;
- Work-at-home workspaces will be provided to support telecommuting by residents of the Project;
- Pedestrian accommodations will be incorporated within the Project site and consist of walkways that connect to the existing sidewalks along Lincoln Street and Mechanic Street;
- A central maildrop will be provided within the building for residents; and
- Secure bicycle parking will be provided for residents, visitors/patrons and commercial tenants, including weather protected bicycle parking in a bike room located within the garage.

With implementation of the aforementioned recommendations, safe and efficient access will continue to be provided to the Project site and the Project can be accommodated within the confines of the existing and improved transportation system.

PUBLIC TRANSPORTATION SCHEDULES

ROUTE 7C: Inner City Marlborough MetroWest Regional Transportation Authority

7C

ROUTE 7C (Monday-Friday Service)

7C

Fare Information

	Cash //	Charlie Card
Adult:	\$1.50 //	\$1.25
Senior (65 years of age or older*):	\$0.75 //	\$0.70
Individuals with Disabilities:	\$0.75 //	\$0.70
Student with valid student ID:	\$1.00 //	N/A
Children under 6 (with adult):	Free	
Active Duty men & women in uniform:	Free	

*To receive the senior discount, a photo ID with birth date listed must be presented. MBTA Access Card, Medicare Card, or MWRTA TAP Pass are accepted as proof of eligibility.

Children under 12 years old may not ride unaccompanied.

Charlie Cards are available free of charge at the MWRTA Blandin Hub or on the bus. Value can be added to existing cards onboard or at an MBTA kiosk.

Transfers / Connections

Transfer slips are available on all MWRTA buses and are good for one transfer going in the same direction within the MWRTA bus system only. Transfers are not compatible with the MBTA system. One transfer per paid fare is issued upon request, and must be presented to the next driver within 90 minutes.

Riders can connect to the MBTA Commuter Rails in Downtown Framingham, West Natick, Natick Center, Ashland, and Southborough, as well as the MBTA Green Line at Woodland.

For MBTA schedule and service information, please call (617) 222-3200.

There is no service provided on the following holidays:

New Year's Day, Patriot's Day, Memorial Day, Independence Day, Thanksgiving Day, Christmas Day.

Scheduled Times

Scheduled times are only approximate; please wait for the MWRTA ten minutes in advance of scheduled times to assure not missing the bus. For up to the minute bus information call the MWRTA at 508-935-2222 or visit www.mwrta.com for GPS tracking.

The MWRTA uses the Flag Down System which allows buses to stop anywhere along their routes to pick up passengers, where it is safe to do so. Passengers can hail MWRTA buses by waving.

* Continues as 7 to Blandin Hub with limited stops.

~Continues from the Route 7.

Transfers

Route 7C passengers can make the following transfers:
Route 7 & 15 at Newton / Weed Sts.

Route 7C services the Blandin Hub at 6:40 am and 12:25 pm going to Marlborough and at 2:30 pm and 8:45 pm from Marlborough.

* Stop may NOT be serviced due to snow/ice.

TRIP-GENERATION CALCULATIONS

Multifamily Housing (Mid-Rise) Not Close to Rail Transit (221)

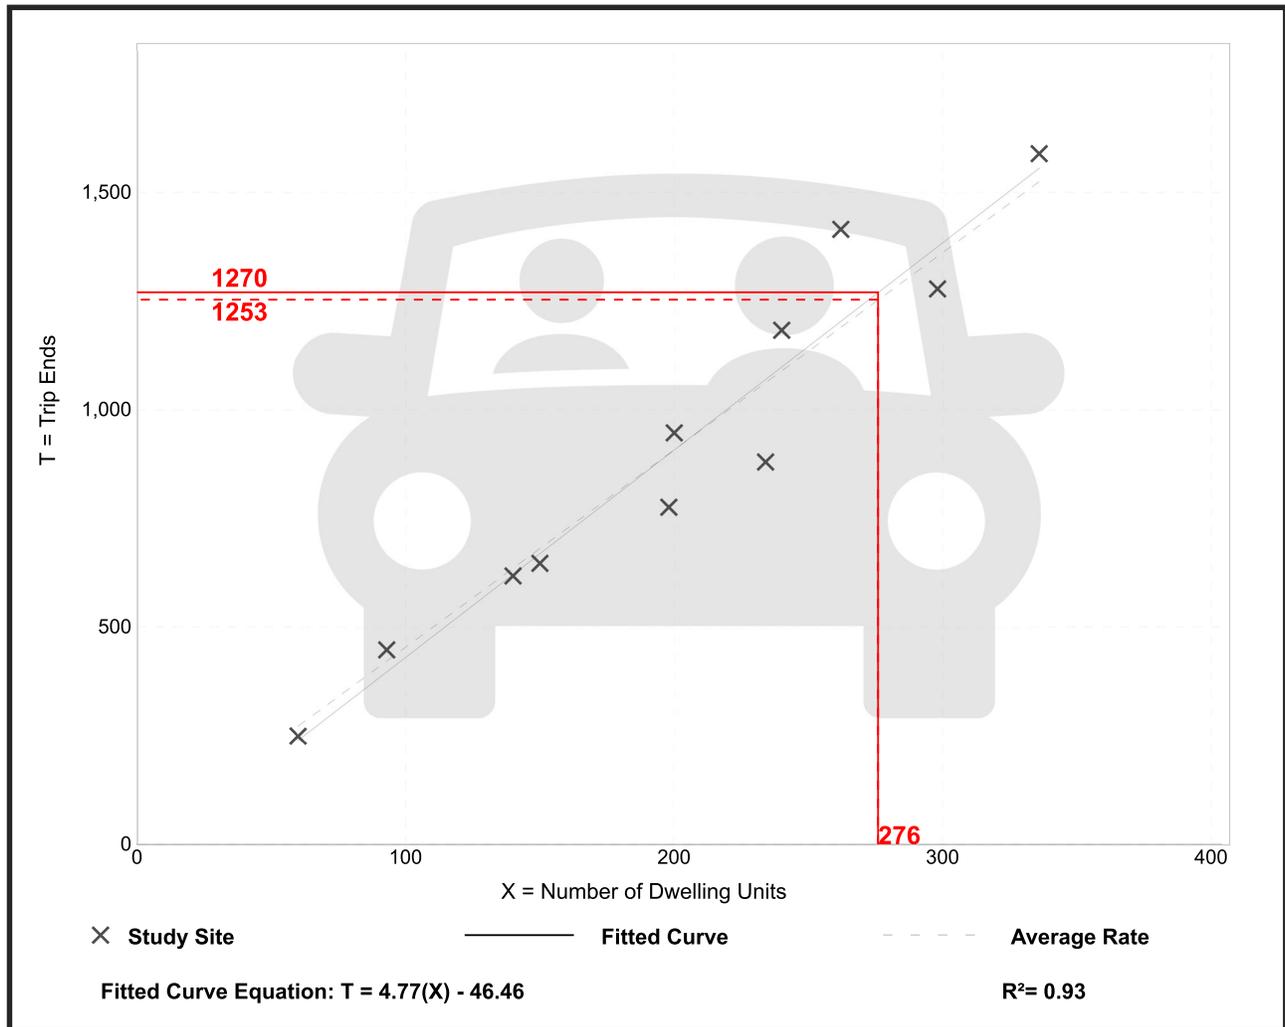

Vehicle Trip Ends vs: Dwelling Units
On a: Weekday

Setting/Location: General Urban/Suburban
Number of Studies: 11
Avg. Num. of Dwelling Units: 201
Directional Distribution: 50% entering, 50% exiting

Vehicle Trip Generation per Dwelling Unit

Average Rate	Range of Rates	Standard Deviation
4.54	3.76 - 5.40	0.51

Data Plot and Equation

Multifamily Housing (Mid-Rise) Not Close to Rail Transit (221)

Vehicle Trip Ends vs: Dwelling Units
 On a: Weekday,
 Peak Hour of Adjacent Street Traffic,
 One Hour Between 7 and 9 a.m.

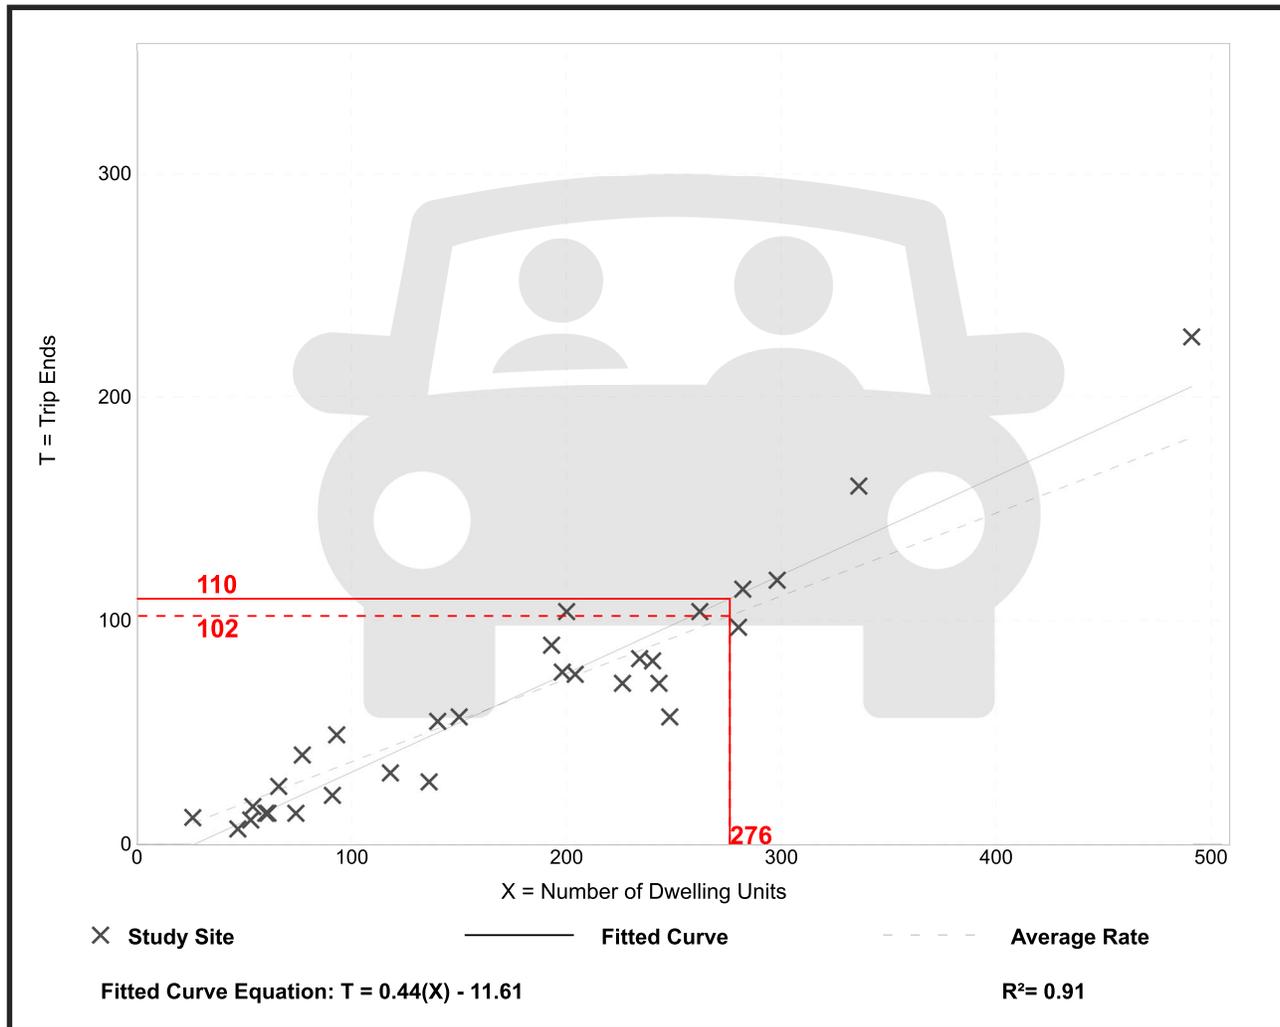

Setting/Location: General Urban/Suburban

Number of Studies: 30
 Avg. Num. of Dwelling Units: 173
 Directional Distribution: 23% entering, 77% exiting

Vehicle Trip Generation per Dwelling Unit

Average Rate	Range of Rates	Standard Deviation
0.37	0.15 - 0.53	0.09

Data Plot and Equation

Multifamily Housing (Mid-Rise) Not Close to Rail Transit (221)

Vehicle Trip Ends vs: Dwelling Units
On a: Weekday,
Peak Hour of Adjacent Street Traffic,
One Hour Between 4 and 6 p.m.

Setting/Location: General Urban/Suburban

Number of Studies: 31

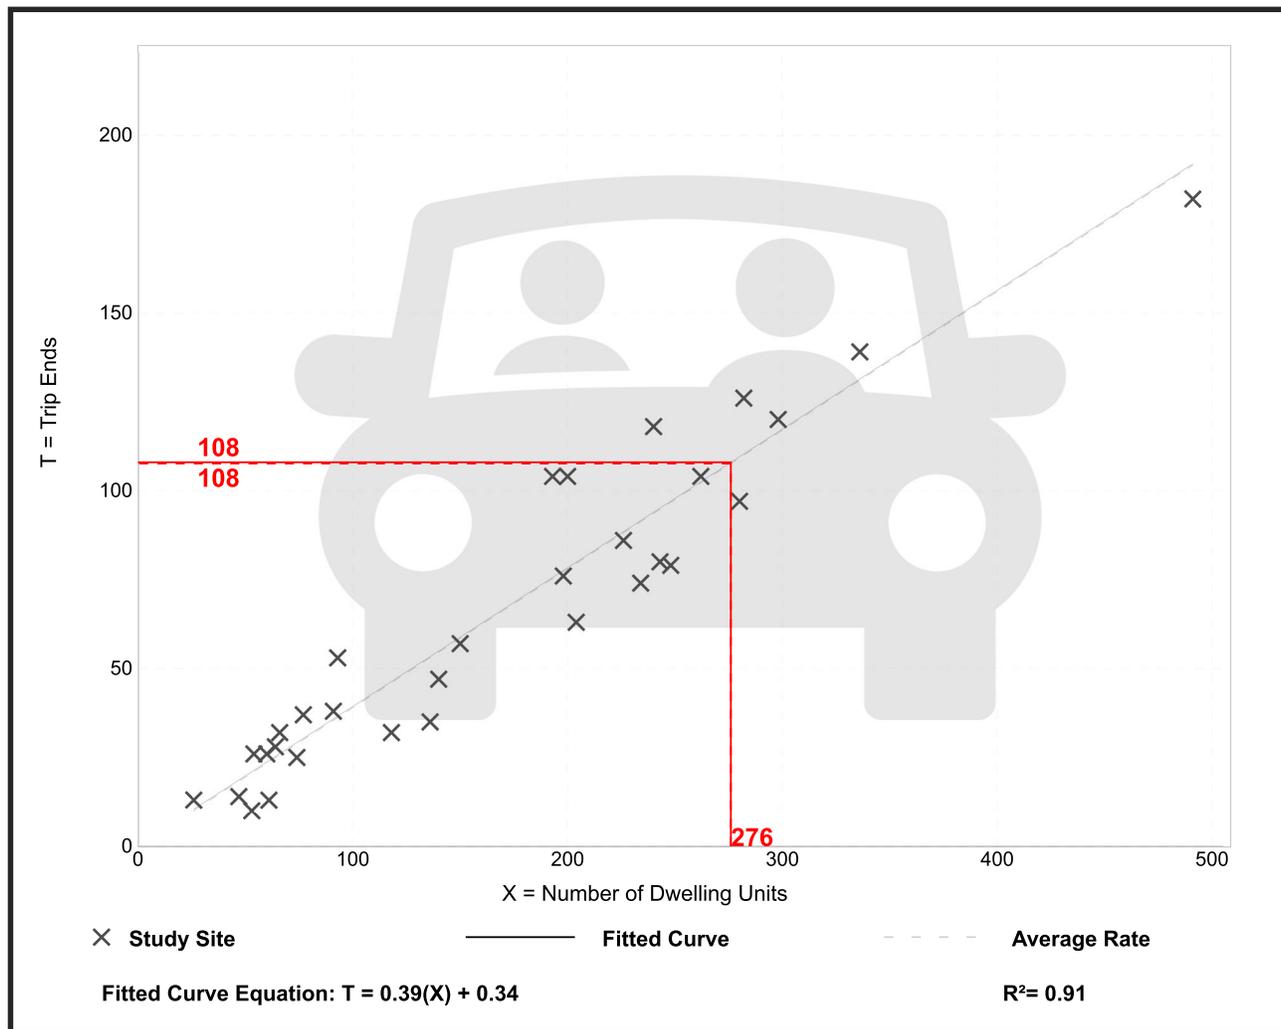

Avg. Num. of Dwelling Units: 169

Directional Distribution: 61% entering, 39% exiting

Vehicle Trip Generation per Dwelling Unit

Average Rate	Range of Rates	Standard Deviation
0.39	0.19 - 0.57	0.08

Data Plot and Equation

Strip Retail Plaza (<40k) (822)

Vehicle Trip Ends vs: 1000 Sq. Ft. GLA
On a: Weekday

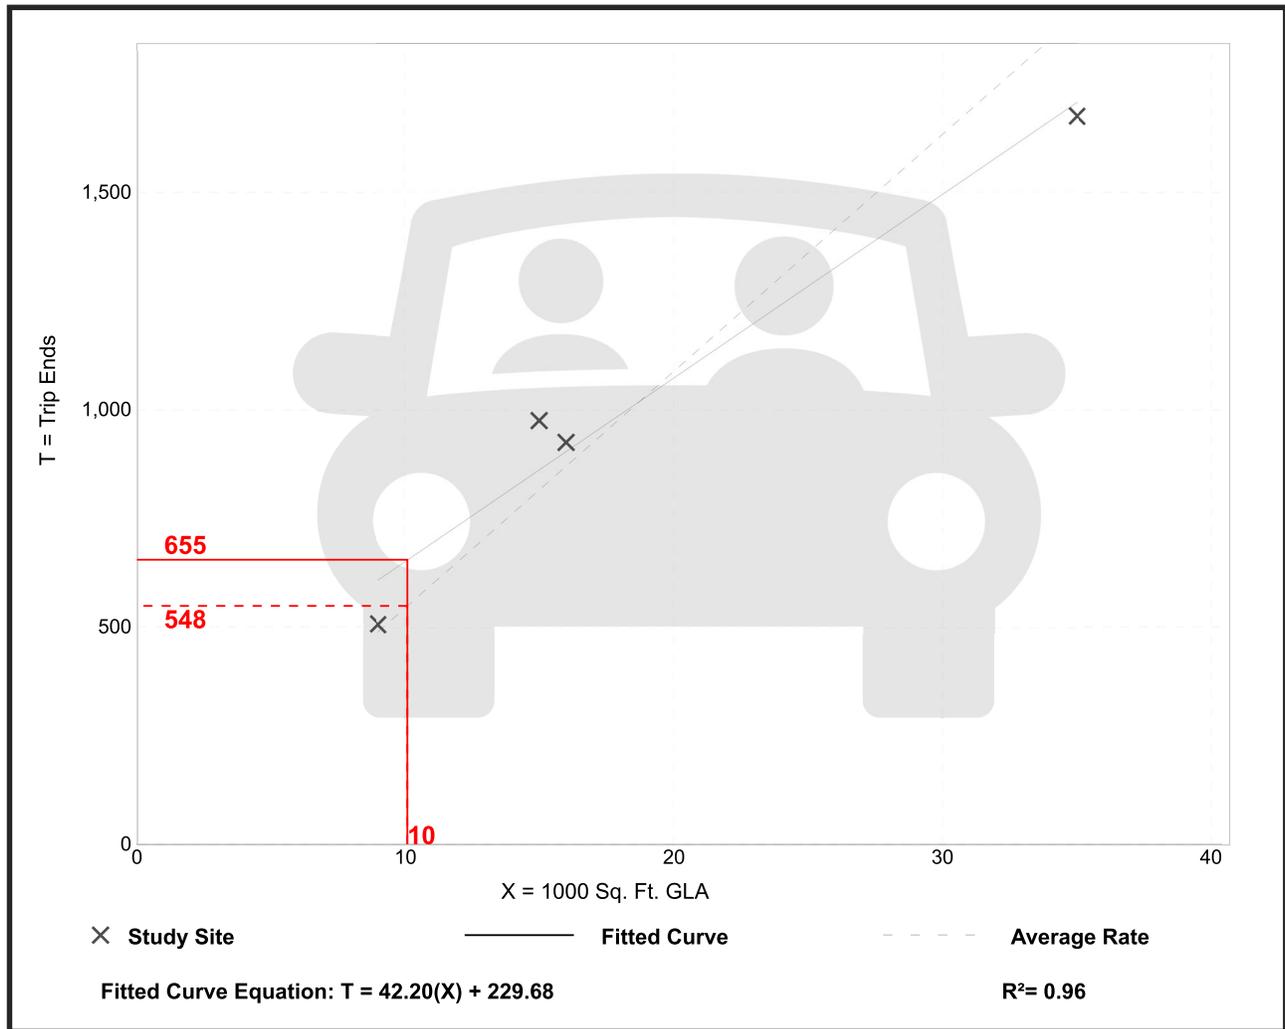

Setting/Location: General Urban/Suburban
Number of Studies: 4
Avg. 1000 Sq. Ft. GLA: 19
Directional Distribution: 50% entering, 50% exiting

Vehicle Trip Generation per 1000 Sq. Ft. GLA

Average Rate	Range of Rates	Standard Deviation
54.45	47.86 - 65.07	7.81

Data Plot and Equation

Caution – Small Sample Size

Strip Retail Plaza (<40k) (822)

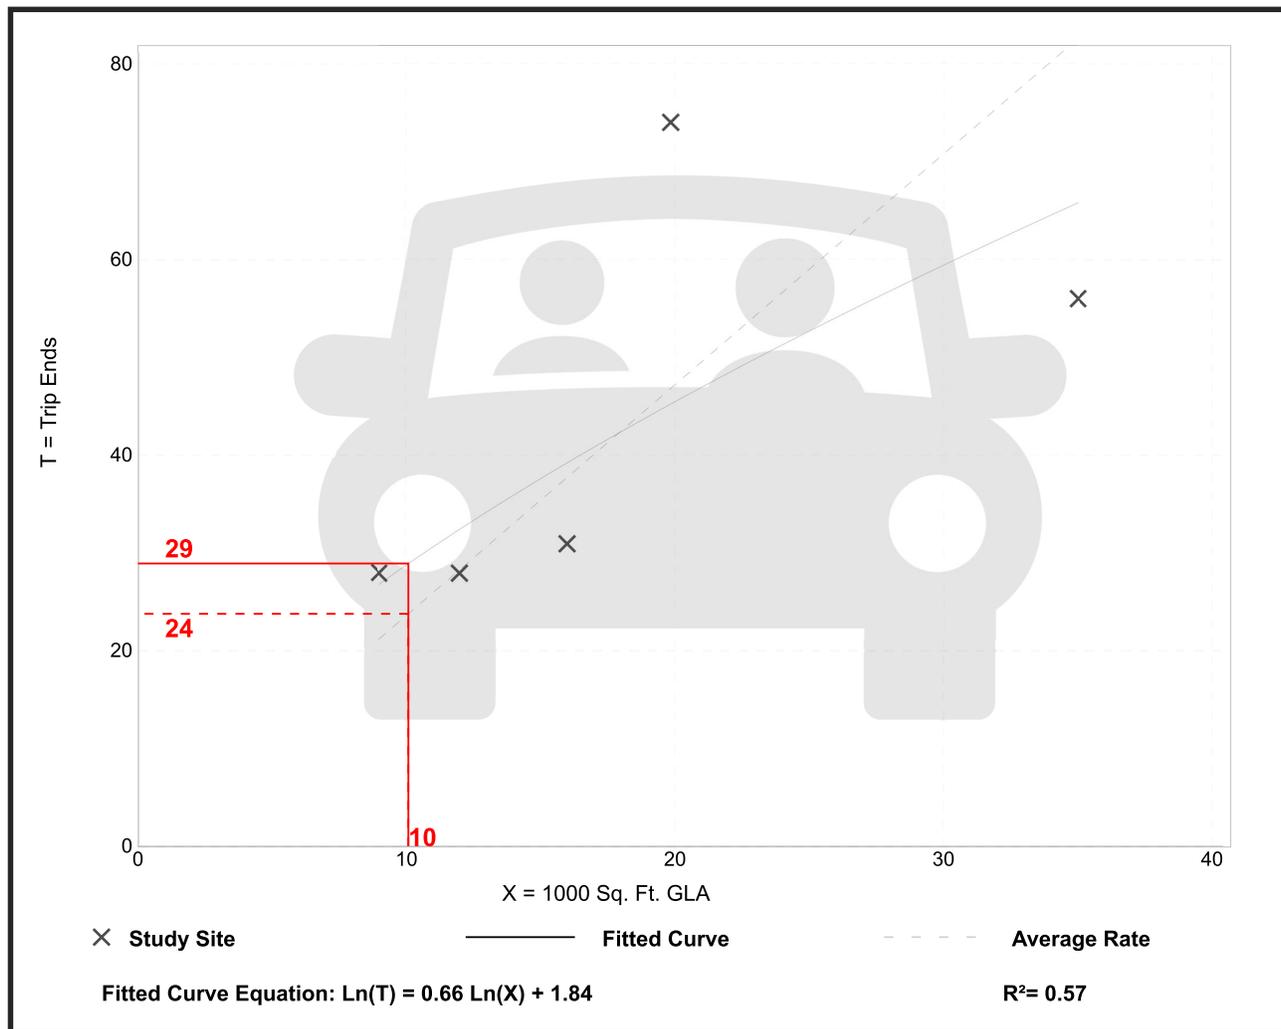

Vehicle Trip Ends vs: 1000 Sq. Ft. GLA
